

Burger press

**An indispensable, robust and highly productive
burger press for use in the food service industry**

OMBT10

Automatic operation is the OMBT's greatest merit. In fact, it only requires pressure on the lever to compress the product and, as the lever returns, it automatically opens the press for the burger to be removed on a cellophane paper. The Rutland burger press is made of stain resistant anodised aluminium. The parts in contact with the product are made of stainless steel and easily removable without tools. The press is supplied with a quantity of cellophane papers and additional papers can be supplied. Two models are available – The OMBT10 (100mm diameter) and the OMBT13 (130mm diameter). The burger press can be used to make patties up to 25 mm thick.
